COMMUNITY HEALTH STATUS

Mobilizing for Action through Planning & Partnerships (MAPP)

Assessment 4

Polk County, Florida
Released October 2011
You are encouraged to review this report online. There are hyperlinks in the report to access more information. Once on the My Polk Health website, select Data/Reports from the menu at the top of the page. Then select Polk MAPP Reports. The title of this report is “2011 Community Health Status Report”.
Introduction

The Community Health Status Assessment was created to highlight the major health and social issues affecting the health status and quality of life in Polk County. It answers the questions, "How healthy are our residents?" and "What does the health status of our community look like?" Where we live, work and play matters to our health.

Everyone has a stake in our community’s health. We all need to work together to find solutions. This report will assist local health system partners to align strategic efforts aimed at improving the health of all people in Polk County. We can improve health outcomes in our county by addressing health factors with effective, evidenced-based programs and policies.

Health outcomes are measures that describe our current health status. This report looks broadly at the leading causes of death and illness, health behaviors, socio-economic factors, and our physical environment.

The Community Health Status Assessment is the fourth of a series of "Mobilizing for Action through Planning and Partnership" (MAPP) assessments. The overall results of the MAPP assessments will be used to develop a Community Health Improvement Plan (CHIP). The CHIP will serve as the strategic plan to improve the health and quality of life for residents of Polk County.

Major Causes of Death and Premature Death

The five leading causes of death and premature death in Polk County are heart disease, cancer, respiratory diseases, injuries and stroke.

Heart Disease

Heart disease is the leading cause of death in Polk County and in Florida. Heart disease continues to be a major cause of disability and a significant contributor to increases in health care costs in the United States. Heart disease death rates reflect the health and well-being of the population as well as the quality of the health care available.

The goals of reducing deaths caused by heart disease include education; outreach; and community involvement. There is a need for increased emphasis on nutrition; smoking cessation; exercise; and monitoring of individual health indicators through routine clinic visits.

Heart Disease

Deaths from heart disease are declining for all races.

A disparity exists between the black and white populations with the black population having a higher death rate, but the gap is narrowing.

Cancer

Cancer is the second leading cause of death in Polk County and in Florida. Suffering and death from cancer can be prevented by organized efforts to:

- reduce tobacco use
- improve diet and physical activity
- reduce obesity
- expand the use of established screening tests

In the last 10 years, the trend in deaths from all cancers is improving.

Healthy People 2020 Target: 160.6 per 100,000 population

Online access: Healthy People 2020 Cancer Objectives and Interventions

Chart 5 demonstrates that deaths from cancer are improving for all races.
Cancer

The cancer death rate for non-Hispanics has been consistently higher than for Hispanics in Polk County and the state.

**CHART 6**

Death Rate for Cancer by Ethnicity

The Florida Department of Health uses quartiles to compare health data from one county to another. A low quartile number (1) always represents more favorable health situations while fours (4) represent least favorable situations. These quartiles are color coded from green to red.

Data source: Florida Department of Health CHARTS. The data is age adjusted. Trends based on three years of data.
**CLRD) Chronic Lower Respiratory Disease (including Asthma)**

The third leading cause of death in Polk County and in Florida is from chronic lower respiratory disease.

Chronic lower respiratory disease refers to chronic (ongoing) diseases that affect the lower respiratory tract. The most prevalent are chronic obstructive pulmonary disease (COPD), emphysema, chronic bronchitis, and smoking-related disorders.  
Source: Florida Department of Health CHARTS

In nearly 8 out of 10 cases, COPD is caused by exposure to cigarette smoke.  
Source: Healthy People 2020

Death rates from chronic lower respiratory disease have been consistently higher than the state over the last 10 years and the gap is widening.

Data source: Florida Department of Health CHARTS. The data is age adjusted.

Healthy People 2020 are a set of national leading health improvement goals.

**Healthy People 2020 Target**: 98.5 deaths per 100,000 population (excludes asthma)

Online access: Healthy People 2020 Respiratory Objectives and Interventions
(CLRD) Chronic Lower Respiratory Disease (including Asthma)

The white population has a higher death rate for CLRD than the black population.

**CHART 8**

Death Rate for Chronic Lower Respiratory Disease by Race

Data source: Florida Department of Health CHARTS. The data is age adjusted.

The death rate for non-Hispanics has been consistently higher than that for Hispanics in Polk County and is higher than the state.

**CHART 9**

Death Rate for Chronic Lower Respiratory Disease by Ethnicity

Data source: Florida Department of Health CHARTS. The data is age adjusted.
Unintentional Injuries

In 2007, Florida’s injury death rates were higher than the national average by:

- 186% for unintentional drownings among children ages 1-4
- 39% for unintentional poisonings
- 23% for unintentional motor vehicle injuries
- 23% for suicides
- 13% for all unintentional injuries

Florida’s death rates in each of these categories were the highest among the nation’s five most populous states: CA, TX, NY, FL, and IL.
Online access: Florida Department of Health, Injury Prevention

Unintentional injuries are the leading cause of death for Florida residents ages 1-44, and the fourth leading cause of death for all ages in Polk County.
Online access: Florida Department of Health, Injury Prevention Strategic Plan

Unintentional Injuries include, but are not limited to, those that result from motor vehicle crashes, falls, fires, poisonings, drownings, suffocations, choking, animal bites, and recreational and sports-related activities.

Injury related deaths can be prevented through direct and indirect community efforts.

Data Source: Florida Department of Health, Office of Vital Statistics. The numbers in the parenthesis are the actual number of deaths.

Poisoning may be related to prescription medication
Stroke

Stroke deaths are the **fifth leading cause of death** in Polk County and in Florida.

High blood pressure is one of the most common causes of stroke because it puts unnecessary stress on blood vessel walls, causing them to thicken and deteriorate, which can eventually lead to a stroke. It can also speed up several common forms of heart disease.

In most people, high blood pressure can be controlled through diet, exercise, medication, or a combination of all three. A diet that is low in salt and rich in vegetables, fruits, and low-fat dairy products may help lower your blood pressure. Recent studies have also shown that increasing potassium intake, for example by eating fresh fruits and vegetables, may help lower blood pressure.

A program of regular exercise, appropriate to age and fitness level and approved by a health care provider, may aid in weight loss and help lower blood pressure.

The data is age adjusted. Trend is getting better and is statistically significant (95% confidence). Data source: Florida Department of Health CHARTS

Healthy People 2020 are a set of national leading health improvement goals.

**Healthy People 2020 Target:** 33.8 deaths per 100,000 population

Online access: [Healthy People 2020 Heart Disease and Stroke Objectives and Interventions](#)
Stroke

Stroke death rates for the black population are higher than the white, however both are trending down and the gap is narrowing.

CHART 12

Death Rate for Stroke by Race

Data source: Florida Department of Health CHARTS. The data is age adjusted.

Stroke death rates for the Hispanic population are lower than non-Hispanic and lower than the state.

CHART 13

Death Rate for Stroke by Ethnicity

Data source: Florida Department of Health CHARTS. The data is age adjusted.
Chronic Diseases

Chronic diseases such as heart disease, cancer, and diabetes are among the most prevalent, costly, and preventable of all health problems. Consideration of deaths alone severely underestimates the burden of chronic disease.

Source: Florida Department of Health

Chronic disease is widespread and impacts everyone, either directly or indirectly. A review of the data confirms that chronic disease is a primary cause of our overall decline in health status.

Source: One Bay Healthy Communities, February 2011

Our state cannot reduce its enormous health care costs, much less its priority health problems, without addressing the prevention of chronic disease in a more aggressive manner. Adopting healthy behaviors such as eating nutritious foods, being physically active and avoiding tobacco use can prevent or control the devastating effects of these diseases.

Source: Florida Department of Health

Risk Factors and Polk County’s Status for Adults and School-Aged Children

The following charts help answer the questions, "How healthy are our residents?" and "What does the health status of our community look like?" The data in these reports provide a picture of Polk County’s health status and will help identify priorities for specific health outcomes in Polk County.

The Florida Department of Health uses quartiles to compare health data from one county to another. A low quartile number (1) always represents more favorable health situations while fours (4) represent least favorable situations. These quartiles are color coded from green to red.

County trends seen in these reports are only calculated for indicators that have 12 or more years of data. Trend Values show:

- Trend is getting better and is statistically significant
- Trend is getting worse and is statistically significant
- Trend is not statistically significant
- N/A Not enough data to compute a trend

a County Quartiles

<table>
<thead>
<tr>
<th>Most favorable situation</th>
<th>Average</th>
<th>Least favorable situation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 (25% of counties)</td>
<td>2 or 3 (50% of counties)</td>
<td>4 (25% of counties)</td>
</tr>
</tbody>
</table>

Quartiles in this report allow you to compare health data from one county to another in the state. Quartiles are calculated by ordering an indicator from most favorable to least favorable by county and dividing the list into 4 equal-size groups. In this report, a low quartile number (1) always represents more favorable health situations while fours (4) represent less favorable situations.

b County Trends

As with rates, there is also random variation in the trend lines of these rates, so that a line that slopes upward may not represent a statistically significant increase, particularly if it is based on small numbers. For that reason, we test statistically to determine whether or not we can be at least 95 percent confident that what appears to be an increase or decrease is real, not just the result of random fluctuation.

Trends only calculated for indicators with 12 or more years of data available.

Click here for more information about trends

Trend Values

- Trend is getting better and is statistically significant
- Trend is getting worse and is statistically significant
- Trend is not statistically significant
- N/A - Not enough data to compute a trend

c Healthy People 2020 Goals

Healthy People 2020 is a national health promotion and disease prevention initiative. Its goals are to increase the quality and years of healthy life and eliminate health disparities. More information available at: [http://www.healthypeople.gov/](http://www.healthypeople.gov/) Goals are not available for every indicator.

Data source: Florida Department of Health CHARTS
Health Disparities

What are health disparities?

Health disparities exists when one group of people get sick or die more often than another group.

For example in Polk:
- Blacks makeup a disproportionate number of hospitalizations from heart disease, stroke and asthma (See Tables 6 & 8).
- Whites have higher diagnoses of hypertension and diabetes (See Tables 6 & 9).
- Hospitalizations from diabetes and from amputations attributable to diabetes are higher in minorities (See Table 9).

Minority Health Profile Report- Black/White
Minority Health Profile Report- Hispanic/Hon-Hispanic

Why is addressing health disparities so important in Polk?

Health disparities contribute to increased healthcare costs. Polk is a very culturally diverse county and failure to address race- and ethnic-based health disparities could be devastating.

It is important that Polk County monitors health disparities to reduce disease burden by identifying high-risk groups, formulating appropriate health care policy, and evaluating progress in eliminating health disparities.

Why do health disparities exist?

According to the Institute of Medicine Report: Unequal Treatment: Confronting Racial and Ethnic Disparities in Health Care health disparities may persist because of differences in access to medical care for racial and ethnic groups and differences in the quality of care received by these groups.

Examples of problems can include:

- Lack of Health Insurance
- Lack of Routine Care
- Health Literacy and Language Barriers
- Provider Prejudices and Stereotyping
- Patient Mistrust and Refusal of Services
- Medically Underserved Communities
- Lack of Participation of Minorities in the Health Professions

Source: Florida Department of Health, Office of Minority Health
Health Disparities

**P- White column** represents the number of whites with the health indicator compared to the total population of whites in Polk County.

**P- Black column** represents the number of blacks with the health indicator compared to the total population of blacks in Polk County.

**P- Hispanic column** represents the number of Hispanics with the health indicator compared to the total population of Hispanics in Polk County.

The highlighted areas in Tables 6 – 10 shows where a racial or ethnic group is disproportionately represented compared to the overall county rate.

For example:

- Blacks makeup a disproportionate number of hospitalizations from heart disease, stroke and asthma (see Tables 6 & 8).
- Whites have a higher diagnoses of hypertension and diabetes (see Tables 6 & 9)
- A higher proportion of white women over 18 received a Pap test in the past year (see Table 7).
- Hospitalizations from diabetes and from amputations attributable to diabetes are higher in minorities (see Table 9).
- Blacks and Hispanics make up a disproportionate number of overweight and obese (see Table 10).

Communicable and Infectious Diseases

Vaccine Preventable Diseases

In our mobile society, over a million people each day travel to and from other countries, where many vaccine-preventable diseases remain relatively common. Without vaccines, epidemics of many preventable diseases could return, resulting in increased and unnecessary illness, disability, and death among children.

We have record or near record low levels of vaccine-preventable childhood diseases in the United States, but that does not mean these have disappeared. Many of the viruses and bacteria are still circulating in this country or are only a plane ride away. That’s why it’s important that children, especially infants and young children receive recommended immunizations on time.

Source: Centers for Disease Control & Prevention (CDC)

The Florida Department of Health uses quartiles to compare health data from one county to another. A low quartile number (1) always represents more favorable health situations while fours (4) represent least favorable situations. These quartiles are color coded from green to red.

Tuberculosis

Many people think that tuberculosis (TB) is a disease of the past — an illness that no longer threatens us today. One reason for this belief is that, in the United States, we are currently experiencing a decline in TB. We are at an all-time low in the number of persons diagnosed with active TB disease. That very success makes us vulnerable to complacency and neglect. But it also gives us an opportunity to eliminate TB in this country.

Source: Centers for Disease Control & Prevention (CDC)

TB can affect anyone but it places a heavier burden on groups such as the poor, foreign-born from countries with high TB rates, people with depressed immune systems and people in institutional settings.

Source: Florida Department of Health

Table 12 shows that although Polk is in the 3rd quartile, the trend is getting better and is statistically significant.

Sexually Transmitted Diseases (STDs)

There are approximately 19 million new cases of STDs in the U. S. each year. Many of those who are infected don’t know it because several STDs do not have any symptoms.

Although many STDs are easily treated and cured, most doctors do not automatically test for chlamydia or other STDs during a yearly checkup, routine pelvic exam or Pap test.

Most males who get an STD never develop any symptoms or health problems.

Source: Florida Department of Health, Bureau of STD Prevention and Control

Chlamydia is the most frequently reported bacterial STD in the United States. Chlamydia cases frequently go undiagnosed and can cause serious problems in men and women as well as infections in newborn babies of infected mothers.
Sexually Transmitted Diseases (STDs)

**Gonorrhea** is the second most commonly reported bacterial STD in the United States. Gonorrhea can spread into the uterus and fallopian tubes, resulting in pelvic inflammatory disease (PID). PID affects more than 1 million women in the United States every year and can cause tubal (ectopic) pregnancy and infertility in as many as 10 percent of infected women. In addition to gonorrhea playing a major role in PID, some health researchers think it adds to the risk of getting HIV infection.

**Syphilis** is a sexually transmitted bacterial infection that causes genital ulcers (sores) in its early stages. If untreated, these ulcers can then lead to more serious symptoms of infection. In 2008, 13,500 cases of syphilis were reported in the United States, mostly in people 20 to 29 years of age. Of these reported cases, 63 percent were among men who have sex with men. Syphilis increases the risk of transmitting as well as getting infected with HIV.

HIV/AIDS

HIV is a preventable disease. Effective HIV prevention interventions have been proven to reduce the spread of HIV. People who get tested for HIV and learn that they are infected can make behavior changes to improve their health and reduce the risk of passing on HIV to their sex or drug-using partners. Most new HIV infections occur when people who have HIV and do not know it, pass it on to others.

People with HIV are living longer, healthier, and more productive lives due to increasingly effective treatments. Deaths from HIV infection have greatly declined in the United States since the 1990s.

As the number of people living with HIV grows, it will be more important than ever to increase national HIV prevention and health care programs.

Health Disparities

What are health disparities?

Health disparities exists when one group of people get sick or die more often than another group.

For example in Polk:

- Blacks and Hispanics makeup a disproportionate number of HIV and AIDS cases (see Table 15).
- The death rate for HIV/AIDS is higher for blacks than for other racial and ethnic groups (see Table 15).

Minority Health Profile Report- Black/White
Minority Health Profile Report- Hispanic/Hon-Hispanic

Why is addressing health disparities so important in Polk?

Health disparities contribute to increased healthcare costs. Polk is a very culturally diverse county and failure to address race- and ethnic-based health disparities could be devastating.

It is important that Polk County monitors health disparities to reduce disease burden by identifying high-risk groups, formulating appropriate health care policy, and evaluating progress in eliminating health disparities.

Why do health disparities exist?

According to the Institute of Medicine Report: Unequal Treatment: Confronting Racial and Ethnic Disparities in Health Care health disparities may persist because of differences in access to medical care for racial and ethnic groups and differences in the quality of care received by racial and ethnic groups.

Examples of problems can include:

- Lack of Health Insurance
- Lack of Routine Care
- Health Literacy and Language Barriers
- Provider Prejudices and Stereotyping
- Patient Mistrust and Refusal of Services
- Medically Underserved Communities
- Lack of Participation of Minorities in the Health Professions

Health Disparities

**P- White column** represents the number of whites with the health indicator compared to the total population of whites in Polk County.

**P- Black column** represents the number of blacks with the health indicator compared to the total population of blacks in Polk County.

**P- Hispanic column** represents the number of Hispanics with the health indicator compared to the total population of Hispanics in Polk County.

Table 15 shows where one where one racial or ethnic group is disproportionately represented compared to the overall county rate.

For example:
- Blacks and Hispanics make up a disproportionate number of reported HIV/AIDS cases

Improving the well-being of mothers, infants, and children is an important public health goal for the United States. Their well-being determines the health of the next generation and can help predict future public health challenges for families, communities, and the health care system.

The risk of maternal and infant death and pregnancy-related complications can be reduced by increasing access to quality preconception (before pregnancy) and interconception (between pregnancies) care. Moreover, healthy birth outcomes and early identification and treatment of health conditions among infants can prevent death or disability and enable children to reach their full potential.

Many factors can affect pregnancy and childbirth, including:
- Preconception health status
- Age
- Access to appropriate preconception and interconception health care
- Poverty

Source: Healthy People 2020

Children born to teen parents are at greater risk for living in poverty, experiencing health problems or difficulty in school, serving time in jail, and/or becoming teen parents themselves.

Charts 14 and 15 show the numbers of live births in Polk County by race, ethnicity and age group for 2005-2009.
The Florida Department of Health uses *quartiles* to compare health data from one county to another. A low quartile number (1) always represents more favorable health situations while fours (4) represent least favorable situations. These quartiles are color coded from green to red.

Health Disparities

What are health disparities?

Health disparities exists when one group of people get sick or die more often than another group.

For example in Polk (see Table 18):

- Blacks makeup a disproportionate number of low birth weight babies.
- Black babies are more likely to die than white or Hispanic babies.
- Hispanics and blacks are more likely to have late or no prenatal care.
- Repeat births to mothers aged 15-19 is more likely to occur among minorities.

Minority Health Profile Report- Black/White
Minority Health Profile Report- Hispanic/Non-Hispanic

Why is addressing health disparities so important in Polk?

Health disparities contribute to increased healthcare costs. Polk is a very culturally diverse county and failure to address race- and ethnic-based health disparities could be devastating.

It is important that Polk County monitors health disparities to reduce disease burden by identifying high-risk groups, formulating appropriate health care policy, and evaluating progress in eliminating health disparities.

Why do health disparities exist?

According to the Institute of Medicine Report: Unequal Treatment: Confronting Racial and Ethnic Disparities in Health Care health disparities may persist because of differences in access to medical care for racial and ethnic groups and differences in the quality of care received by racial and ethnic groups.

Examples of problems can include:

- Lack of Health Insurance
- Lack of Routine Care
- Health Literacy and Language Barriers

The significant improvement in the oral health of Americans over the past 50 years is a result of effective prevention and treatment efforts. One major success is community water fluoridation, which now benefits about 7 out of 10 Americans who get water through public water systems.

School-based dental sealant programs and community water fluoridation and are two leading evidence-based interventions to prevent tooth decay.

Source: Healthy People 2020

In March 2009, The Polk County Health Department Dental Program received a $50,000 grant to start a school based sealant program for the Lake Wales Area Schools. The school based sealant program has served 1,417 students, placing sealants on 4,388 first permanent molars in the last two years.

Over 40% of Polk County’s population does not have access to fluoridated water.

Oral Health

People who have the least access to preventive services and dental treatment have greater rates of oral diseases.

The Florida Department of Health uses quartiles to compare health data from one county to another. A low quartile number (1) always represents more favorable health situations while fours (4) represent least favorable situations. These quartiles are color coded from green to red.

Polk County is in the least favorable quartile for adults’ visits to the dentist in the past year.

Health Disparities

What are health disparities?
Health disparities exists when one group of people get sick or die more often than another group.

For example in Polk:
- Fewer black and Hispanic adults see a dentist annually due to cost (See table 20).

Minority Health Profile Report- Black/White
Minority Health Profile Report- Hispanic/Hon-Hispanic

Why is addressing health disparities so important in Polk?

Health disparities contribute to increased healthcare costs. Polk is a very culturally diverse county and failure to address race- and ethnic-based health disparities could be devastating.
Health Disparities

It is important that Polk County monitors health disparities to reduce disease burden by identifying high-risk groups, formulating appropriate health care policy, and evaluating progress in eliminating health disparities.

Why do health disparities exist?

According to the *Institute of Medicine Report: Unequal Treatment: Confronting Racial and Ethnic Disparities in Health Care* health disparities may persist because of differences in access to medical care for racial and ethnic groups and differences in the quality of care received by racial and ethnic groups.

Examples of problems can include:

- Lack of Health Insurance
- Lack of Routine Care
- Health Literacy and Language Barriers
- Provider Prejudices and Stereotyping
- Patient Mistrust and Refusal of Services
- Medically Underserved Communities
- Lack of Participation of Minorities in the Health Professions

Source: Florida Department of Health, Office of Minority Health

The following table highlights where racial and ethnic disparities exist.

**P- White column** represents the number of whites with the health indicator compared to the total population of whites in Polk County.

**P- Black column** represents the number of blacks with the health indicator compared to the total population of blacks in Polk County.

**P- Hispanic column** represents the number of Hispanics with the health indicator compared to the total population of Hispanics in Polk County.

Table 20 shows where one where one racial or ethnic group is disproportionately represented compared to the overall county rate.

For example:

- Blacks and Hispanics make up a disproportionate number of people who could not see a dentist in the past year because of cost.

Data Source: Florida Department of Health Behavioral Risk Factors Surveillance System (BRFSS)

Healthy People 2020 are a set of national leading health improvement goals.

Online access: Healthy People 2020 Oral Health Objectives and Interventions
Mental Health

According to Healthy People 2020, mental health and physical health are closely connected. Mental health plays a major role in people’s ability to maintain good physical health. Mental illnesses, such as depression and anxiety, affect people’s ability to participate in health-promoting behaviors. In turn, problems with physical health, such as chronic diseases, can have a serious impact on mental health and decrease a person’s ability to participate in treatment and recovery.

Source: Healthy People 2020

The National Alliance for Mental Illness (NAMI) recently released its 2009 report card of states and Florida received an overall “D” grade. According to the report, Floridians living with mental illness face uphill battles to get appropriate services due to a lack of funding and a shortage of mental health providers. The report’s authors noted concern with Florida’s insufficient efforts to address cultural competence and the inadequate supply of mental health professionals.

Source: One Bay Healthy Communities Report – February 2011

There are many sources that provide data for the state of Florida and the nation, such as the Florida Council of Community Mental Health (FCCMH) and the Substance Abuse and Mental Health Services Administration (SAMHSA). County level data is unavailable. However, the 2007 Behavioral Risk Factor Surveillance System (BRFSS) survey data contains county-level estimates of the prevalence of personal health behaviors that contribute to morbidity and mortality.

The Florida Department of Health uses quartiles to compare health data from one county to another. A low quartile number (1) always represents more favorable health situations while fours (4) represent least favorable situations. These quartiles are color coded from green to red.

Data Source: Florida Department of Health CHARTS

Healthy People 2020 are a set of national leading health improvement goals.

**Healthy People 2020 Target:** An indicator for Healthy People 2020 to improve the mental health status of the community is to reduce the suicide rate.

Online access: [Healthy People 2020 Mental Health Objectives and Interventions](#)
Mental Health

About 15 percent of the population will suffer from clinical depression at some time during their lifetime. Thirty percent of all clinically depressed patients attempt suicide; half of them ultimately die by suicide.

Source: American Foundation for Suicide Prevention, accessed 2010

Studies indicate that the best way to prevent suicide is through the early recognition and treatment of depression and other psychiatric illnesses.

Source: Florida Council for Community Mental Health – November 2010

The rate of suicides among 19-21 year olds in Polk County has doubled in the last 10 years.

CHART 17

Suicide Death Rate

Data Source: Florida Department of Health, Bureau of Vital Statistics

CHART 18

Polk County Suicide Rate by Age Group

Data Source: Florida Department of Health, Bureau of Vital Statistics
Substance Abuse, Alcohol, Illegal Substances and Tobacco

In 2005, an estimated 22 million Americans struggled with a drug or alcohol problem. Almost 95 percent of people with substance use problems are considered unaware of their problem. Of those who recognize their problem, 273,000 have made an unsuccessful effort to obtain treatment. These estimates highlight the importance of increasing prevention efforts and improving access to treatment for substance abuse and co-occurring disorders.

Most people with a substance abuse problem are unaware of their problem.

Substance abuse has a major impact on individuals, families, and communities. The effects of substance abuse contribute to costly social, physical, mental, and public health problems.

These problems include:

- Teenage pregnancy
- HIV/AIDS
- Sexually transmitted diseases
- Domestic violence
- Child abuse
- Motor vehicle crashes
- Physical fights
- Crime
- Homicide
- Suicide

Social attitudes and political and legal responses to the consumption of alcohol and illicit drugs make substance abuse one of the most complex public health issues. In addition to the many health implications, substance abuse has been a flash-point in the criminal justice system and a major focal point in discussions about social values: people argue over whether substance abuse is a disease with genetic and biological foundations or a matter of personal choice.

Source: Healthy People 2020

According to the 2008 National Survey on Drug Use and Health, the overall rate of drug and alcohol use and abuse is about 8.9% of the general population over age 12. This would amount to approximately 58,723 persons in the tri-county area. DCF reports they have most recently served 6,829 adults and children in substance abuse services for FY 2008-2009, representing only about 12% of those estimated in need.

Almost 60,000 people in the tri-county area could have a substance abuse problem.

Health Disparities

What are health disparities?

Health disparities exist when one group of people get sick or die more often than another group.

Minority Health Profile Report- Black/White
Minority Health Profile Report- Hispanic/Non-Hispanic

Why is addressing health disparities so important in Polk?

Health disparities contribute to increased healthcare costs. Polk is a very culturally diverse county and failure to address race- and ethnic-based health disparities could be devastating.

It is important that Polk County monitors health disparities to reduce disease burden by identifying high-risk groups, formulating appropriate health care policy, and evaluating progress in eliminating health disparities.

Why do health disparities exist?

According to the Institute of Medicine Report: Unequal Treatment: Confronting Racial and Ethnic Disparities in Health Care, health disparities may persist because of differences in access to medical care for racial and ethnic groups and differences in the quality of care received by racial and ethnic groups.

Examples of problems can include:

- Lack of Health Insurance
- Lack of Routine Care
- Health Literacy and Language Barriers
- Provider Prejudices and Stereotyping
- Patient Mistrust and Refusal of Services
- Medically Underserved Communities
- Lack of Participation of Minorities in the Health Professions

Tobacco

Each year, approximately 443,000 Americans die from tobacco-related illnesses. For every person who dies from tobacco use, 20 more people suffer with at least 1 serious tobacco-related illness. In addition, tobacco use costs the U.S. $193 billion annually in direct medical expenses and lost productivity.

**Tobacco use** causes:
- Cancer
- Heart disease
- Lung diseases (including emphysema, bronchitis, and chronic airway obstruction)
- Premature birth, low birth weight, stillbirth, and infant death

There is no risk-free level of exposure to **secondhand smoke**. Secondhand smoke causes heart disease and lung cancer in adults and a number of health problems in infants and children, including:
- Severe asthma attacks
- Respiratory infections
- Ear infections
- Sudden infant death syndrome (SIDS)

**Smokeless tobacco** causes a number of serious oral health problems, including cancer of the mouth and gums, periodontitis, and tooth loss. Cigar use causes cancer of the larynx, mouth, esophagus, and lung.

Preventing tobacco use and helping tobacco users quit can improve the health and quality of life for Americans of all ages. People who stop smoking greatly reduce their risk of disease and premature death. Benefits are greater for people who stop at earlier ages, but quitting tobacco use is beneficial at any age.

Healthy People 2020 are a set of national leading health improvement goals.

Online access: [Healthy People 2020 Tobacco Use Objectives and Interventions](#)
Population Demographics

Polk County’s population is 602,095, a 24.4% increase in overall population between the 2000 and 2010 census. Polk County’s Hispanic population and those identified as other races (Asian, American Indian and other) have had the largest increase since 2000.

CHART 19 Polk County Population by Race/Ethnicity

The percentage of Polk County’s population aged 65 and older is 18% compared to the national average of 13%. This population accesses the health care system more frequently than other age group and has created greater demand for health care services and end of life care.

Source: One Bay Healthy Communities, February 2011

CHART 20 Polk County Population by Age and Gender, 2010

Data Source: 2010 Census Data
The median household income for families dropped in 2010 compared to 2009. Polk County experienced the biggest drop compared to the state and nation.

**CHART 21**

![Median Family Income Chart]

Data Source: U.S. Census Bureau

In Polk County 13% of all families live in poverty and 23% of those families have children under age 18 living with them. Chart 22 demonstrates that the largest percentage living in poverty live in families where a female is head of the household.

**CHART 22**

![Families in Poverty 2010 Chart]

Data Source: U.S. Census Bureau.
Population Demographics

According to the 2009/2010 Poverty Guidelines from the US Department of Health and Human Services:

- $22,050 annual income for a family of four is considered 100% of the poverty level
- $33,075 annual income for a family of four is considered 150% of the poverty level
- $44,100 annual income for a family of four is considered 200% of the poverty level

Chart 23 shows the distribution of income among households in Polk County.

**CHART 23**

Polk County Household Income, 2005-2009

- Less than $15,000: 32%
- $15,000 to $34,999: 17%
- $35,000 to $49,999: 26%
- $50,000 to $99,999: 13%
- $100,000 to $199,999: 2%
- $200,000 or more: 10%

Data Source: 2005-2009 American Community Survey 5-Year Estimates

- Florida ranks 43rd in the nation for unemployment (July 2011).
- Out of the 18 large metropolitan areas in Florida, the Lakeland/Winter Haven metropolitan area ranks 13 (July 2011).

**CHART 24**

Unemployment Rate, Comparison of 2000 and 2011 Rates

- Polk: 2000 - 5.0%, 2011 - 3.9%
- Florida: 2000 - 12.1%, 2011 - 10.7%

Data Source: U.S. Bureau of Labor Statistics
Note: Both data sets were from the month of July 2011 and were not seasonally adjusted.
According to the American Community Survey, 55% of Polk County’s population aged 25 and over have a high school diploma or less and 18% have a degree in higher education.

Physical Environment

Where you live can have an impact on your health and your ability to stay healthy. This section looks at air quality, access to healthy foods and access to recreational facilities.

Air Quality

National air quality has improved over the last 20 years. However, there are still many challenges in protecting public health and the environment from outdoor air quality problems. Chemicals in the air, like particle pollution and ozone may increase health risks to certain people, particularly children, older adults, people with asthma, heart, lung disease, or breathing problems.

Source: Florida Department of Health, Division of Environmental Health

displayed as a table, showing the percent of days that air quality was unhealthy for sensitive populations due to fine particulate matter (FPM, < 2.5 µm in diameter).

</tbody>
</table>

Data Source: The U.S. Environmental Protection Agency.
The US EPA 24 hour National Ambient Air Quality Standard for pm2.5 is 35 micrograms per cubic meter of air (mcg/m3).
**Physical Environment**

**Ozone** is a gas that you cannot see or smell that occurs naturally in the sky about 10 to 30 miles above the earth's surface. Some ozone is "good ozone" because it forms a layer that protects life on earth from the sun's harmful rays.

Ground-level ozone forms when pollutants from cars and trucks, power plants, factories, and other sources come in contact with each other in heat and sunlight. Factors such as weather conditions and intensity of sunlight also play a part in how ozone is formed.

Everyone should be concerned about exposure to very high ozone levels. But ozone bothers some people more than others, mainly when they are outside.

Those most likely to be bothered by ozone include:
- people with asthma or lung disease
- children who spend a lot of time outdoors
- older adults
- active people of all ages who exercise or work hard outside
- infants.

Source: Florida Department of Health, Division of Environmental Health

The national benchmark for ozone is 0. Table 31 shows the number of days during the years 2001-2008 when ozone concentrations were over 0.

### TABLE 31

Physical Environment

Access to Healthy Foods

Studies have shown that people are more likely to eat healthy foods if they have access to them.

Access to healthy foods is measured as the percent of zip codes in a county with a healthy food outlet, defined as a grocery store or produce stand/farmers’ market.
Source: County Health Rankings

The counties are shaded with lighter counties having a better rank. In Florida, 20 counties meet or exceed the national benchmark of 92%.
Data Source: County Health Rankings

In 2008, 75% of Polk County’s zip codes had a healthy food outlet (24 of 32 zip codes).

County Health Rankings, Access to Healthy Foods - Polk
Physical Environment

Access to Recreational Facilities

Being near places with recreational opportunities is associated with higher physical activity levels. This in turn is associated with lower rates of adverse health outcomes associated with poor diet, lack of physical activity, and obesity.

The availability of recreational facilities can influence individuals' and communities' choices to engage in physical activity. Recreational facilities are defined as establishments primarily engaged in operating fitness and recreational sports activities. This measure represents the number of recreational facilities per 100,000 population in a given county.

Source: County Health Rankings

The lighter shaded counties have a better ranking. In Florida, two counties meet or exceed the national benchmark of 17.

Data Source: County Health Rankings

In 2008, Polk County’s recreational facility access rate per 100,000 population was 6.

Healthy People 2020 are a set of national leading health improvement goals.

Glossary of Terms

3-year Rolling Rates
3-year rates are calculated by taking the average number of events and average total population.

Age-adjusted Death Rates (AADR)
An AADR is a death rate that has been adjusted for age distribution within a given population, or community.

Binge Drinking
Consuming four or more alcoholic drinks for women and five or more alcoholic drinks for men on one occasion.

Birth Rate
The number of births per 1,000 resident population.

Body Mass Index (BMI)
A measure used to estimate the amount of excess body weight. BMI is calculated using self-reported height and weight.

Chronic Disease
An illness, such as heart disease, asthma, or diabetes, that is ongoing or recurring but is not caused by infection and is not passed on by contact.

Chronic Obstructive Pulmonary Disease (COPD/CLRD)
A progressive lung disease process characterized by difficulty breathing, wheezing, and a chronic cough. Complications include bronchitis, pneumonia, and lung cancer.

Community Health Assessment
One of the assessments in the series of Mobilizing for Action through Planning and Partnerships (MAPP) process. This assessment highlights the major health and social issues affecting the health status and quality of life in Polk County.

Community Health Improvement Plan (CHIP)
A community-wide strategic plan for systematic health improvement at the individual and community levels. This plan is build through collaborative analysis and partnership, and is adopted by the community-at-large.
County Trends
County trends seen in these reports are only calculated for indicators that have 12 or more years of data. Trend Values show:

- Trend is getting better and is statistically significant
- Trend is getting worse and is statistically significant
- Trend is not statistically significant

Blank cell or N/A - Not enough data to compute a trend

As with rates, there is also random variation in the trend lines of these rates, so that a line that slopes upward may not represent a statistically significant increase, particularly if it is based on small numbers. For that reason, we test statistically to determine whether or not we can be at least 95 percent confident that what appears to be an increase or decrease is real, not just the result of random fluctuation.

Current Smokers
Adults who have ever smoked at least 100 cigarettes and who smoked on some or all days in the previous 30 days.

Demographics
The statistical characteristics of human populations and households (such as age or income).

Dental Sealant
Sealants are thin plastic coatings applied to the tiny grooves on the chewing surfaces of the back teeth. This is where most tooth decay in children and teens occurs. Sealants protect the chewing surfaces from decay by keeping germs and pieces of food out.

Diabetes
A chronic health condition where the body is unable to produce insulin and properly break down sugar (glucose) in the blood. Symptoms include hunger, thirst, excessive urination, dehydration and weight loss. The treatment of diabetes requires daily insulin injections, proper nutrition and regular exercise.

Disparities
Socioeconomic or health inequality or difference relative to the local community or wider society to which an individual, family or group belongs.

Former Smokers
Adults who have ever smoked at least 100 cigarettes, but did not smoke on any of the previous 30 days.

Haemophilus Influenza
A severe bacterial infection, occurring primarily in infants and children under 5 years.

Health Disparities
Health disparities exists when one group of people get sick or die more often than another group. A health issue affects one group disproportionately.
Health Insurance Coverage
Includes health insurance, prepaid plans such as HMOs, and government plans such as Medicare.

Healthy People 2020
Healthy People 2020 is a national health promotion and disease prevention initiative. Its goals are to increase the quality and years of healthy life and eliminate health disparities. More information available at: http://www.healthypeople.gov/. Goals are not available for every indicator.

Healthy Weight
Having a Body Mass Index (BMI) between 18.5 and 24.9. BMI is calculated using self-reported height and weight.

Heavy Drinking (also called chronic drinking)
In the previous 30 days, women consuming an average of one or more alcoholic drinks per day or men consuming an average of two or more alcoholic drinks per day.

Hepatitis
Inflammation of the liver. May be caused by bacterial or viral infection, parasitic infestation, alcohol, drugs, toxins, or transfusion of incompatible blood. Although many cases of hepatitis are not a serious health threat, the disease can become chronic and sometimes lead to liver failure and death.

Hepatitis A
A contagious liver disease that results from infection with the Hepatitis A virus. It can range in severity from a mild illness lasting a few weeks to a severe illness lasting several months. Hepatitis A is usually spread when a person ingests fecal matter — even in microscopic amounts — from contact with objects, food, or drinks contaminated by the feces or stool of an infected person.

High Risk Behavior Groups
Those who have had sex with a man who has had sex with other men, used intravenous street drugs, traded sex for money or drugs, tested positive for HIV, had two or more sex partners in the past year, or who had sex with anyone who would be categorized in any of these groups listed.

HIV
Human immunodeficiency virus (HIV) is a retrovirus that causes acquired immunodeficiency syndrome (AIDS), a condition in humans in which the immune system begins to fail, leading to life-threatening opportunistic infections.

Hypertension/High Blood Pressure
A condition of elevated blood pressure that can lead to kidney disease, heart disease and stroke.

Indicator
Something observed or calculated that is used to show the presence or state of a condition or trend.
Influenza
Influenza, also known as the flu, is a contagious disease that is caused by the influenza virus. It attacks the respiratory tract in humans (nose, throat, and lungs). People age 65 years and older, people of any age with chronic medical conditions, and very young children are more likely to get complications from influenza. Pneumonia, bronchitis, and sinus and ear infections are three examples of complications from flu.

Infant Death (Mortality) Rate
The number of deaths to individuals less than one year of age (0-364 days old) per 1,000 live births.

Low Birth Weight
Infants born who weighed less than 2500 grams (5 lbs., 8.2 oz) at birth.

Mammogram
An x-ray of each breast to look for breast cancer.

Mobilizing for Action Through Planning and Partnerships (MAPP)
A tool to help communities prioritize public health issues, identify resources for addressing them and take action.

Moderate Physical Activity
Brisk walking, bicycling, vacuuming, gardening, or anything that causes some increase in breathing.

Neonatal Death Rate
The number of deaths to individuals 0-27 days old per 1,000 live births.

Obese
Having a Body Mass Index (BMI) that is greater than or equal to 30.0. BMI is calculated using self-reported height and weight.

Overweight
Having a Body Mass Index (BMI) ranging from 25.0 to 29.9. BMI is calculated using self-reported height and weight.

Overweight and Obese
Having a Body Mass Index (BMI) that is greater than or equal to 25.0.

Pap Test
A cervical cancer screening test in which surface cells from the cervix are examined for cancer or pre-cancer characteristics.

Perinatal
Relating to or occurring during the period around childbirth, specifically from around week 28 of pregnancy to around one month after the birth.

Pertussis
A bacterial infection of the respiratory tract characterized by short, convulsive coughs that end in a whoop sound when breath is inhaled (commonly called whooping cough); mainly affects children.
Polk Health Care Alliance
A task force of over 30 community health care and social service representatives whose mission is to create conditions for a healthier community whose citizens achieve a high quality of life, and to ensure access to affordable quality health care.

Poor Mental Health
Adults who report that their mental health, which includes stress, depression, and problems with emotions, was not good on 14 or more of the previous 30 days.

Postneonatal Death Rate
The number of deaths to individuals 28-364 days old per 1,000 live births.

Prenatal
Existing or happening during pregnancy but before childbirth.

Quartile
The Florida Department of Health uses quartiles to compare health data from one county to another in the state. These are calculated by ordering an indicator from most favorable to least favorable by county and dividing the list into 4 equal-size groups. In this report, a low quartile number (1) always represents more favorable health situations while fours (4) represent less favorable situations.
  1 - Most favorable situation (25% of counties)
  2 or 3 - Average (50% of counties)
  4 - Least favorable situation (25% of counties)

Secondhand Smoke
Being exposed to someone else’s tobacco smoke in a room (at work or home) during the past seven days.

Sigmoidoscopy/Colonoscopy
Exams in which a tube is inserted in the rectum to view the colon for signs of cancer or other health problems.

Teen Birth Rate
The number of births to teenage females per 1,000.

Tobacco Cessation Services
Medical and/or psychobehavioral treatment that seeks to reduce or eliminate the use of tobacco products.

Unintentional Injuries – include motor vehicle crashes, falls, fires, poisonings, drownings, suffocations, choking, animal bites and recreational and sports-related activities.

Very Low Birth Weight
Infants born who weighed less than 1500 grams (3 lbs., 5 oz) at birth.

Vigorous Physical Activity
Running, aerobics, heavy yard work or anything that causes a large increase in breathing.
